

COBRO IMS

Client System Walkthrough

Presenter's Script & Live Demonstration Guide — v3 (fully live build)

Nothing in this version is assumed to already exist except what the application genuinely has no screen to create. You will sign in as Sarisha, and build the entire demo environment in front of the client: the users, the department, the products, the stock, and the requisition — one continuous example, reused by name and reference from the first page to the last.

Every navigation, click, selection, typed value and submission is written into the sentence you say. Every exact value you need to type is shown in a green INPUT DATA box immediately next to the sentence that uses it — you never need a second document.

For internal presenter use only — not for distribution to the client.

How to Use This Document

Read every plain paragraph aloud, in your own voice, and perform the action it describes as you say it. Where a green INPUT DATA box follows a paragraph, that box is what you type or select — the paragraph above it already told you, and why.

Lines starting with “PRESENTER NOTE:” are for you only — never read these aloud.

Marker	Meaning
[CREATE]	You are about to build a new piece of data live — a user, a product, a department, a requisition. The INPUT DATA box beneath it is what you enter.
[NAVIGATE]	A spoken paragraph that explains why, and tells you which screen you're moving to, as you say it.
[DEMONSTRATE]	A spoken paragraph that explains why, and tells you what you're clicking, selecting or submitting, as you say it.
[EXPLAIN]	A spoken paragraph with no action — just talk the audience through a concept.
[ROLE SWITCH]	A spoken paragraph that explains why responsibility is moving to someone else, and tells you to sign out and sign back in, as you say it.
[IMPORTANT / BACKUP]	A caution, or a ready-made fallback sentence if something on screen doesn't behave exactly as expected.
[CLIENT CONFIRMATION]	A moment to pause and ask the client a specific question, worded as a professional next step.

Live Demo Data — Master List (keep this consistent)

Every value below is created or used, in this order, and never changes once created. If a name is already taken in your system from earlier testing, add your initials to keep it unique, but keep everything else identical.

ADMIN — already exists, do not create

INPUT DATA

Name	Sarisha
Email	sarisha@cobro.co.za
Password	Your own prepared password — never invent one

USERS — created live, in Part 9

INPUT DATA

Stores Clerk	Lerato Dlamini · lerato.dlamini@cobro.co.za
Mechanical Team Leader	Sipho Khumalo · sipho.khumalo@cobro.co.za · Area: Mechanical
Electrical Team Leader	Naledi Maseko · naledi.maseko@cobro.co.za · Area: Electrical
Engineer / Requester	Thabo Mokoena · thabo.mokoena@cobro.co.za · Area: Mechanical

Passwords for all four: generated by the system the moment each is created, and shown on screen — read it off the success message, never invent it.

Stores Assistant (Kabelo Ndlovu, kabelo.ndlovu@cobro.co.za) is deliberately NOT created — see Part 9, this role does not exist in the system today.

DEPARTMENT — created live, in Part 10

INPUT DATA

Name	Mechanical Workshop
------	---------------------

PRODUCTS — created live, in Part 11

INPUT DATA

Ordinary item	Steel Trowel · SKU COB-STL-001 · ea · barcode 6009876543210 · no category · reorder 10 / 20 · R185.00
Repair item	Concrete Pump Motor · SKU COB-REP-001 · ea · barcode 6001234567890 · Repair items category · reorder 2 / 4 · R2,850.00

STORE — must already exist, cannot be created (see Part 2)

The system has no screen to create a new Store/Facility warehouse — at least one must already be configured. This script calls it "Main Store"; say your real store's actual name wherever this appears.

THE REPAIR STORY — spoken throughout, from Part 12 onward

INPUT DATA

Repair reference	REP-2026-001 — spoken only, no system field yet (see Part 12)
Asset	No. 2 Machine — spoken only
Site	Main Production Facility — spoken only
Workshop / Department	Mechanical Workshop — real field, created above
Engineer	Thabo Mokoena
Product	Concrete Pump Motor
Quantity requested	2 (one will be used, one returned — see Parts 16–17)
Unit value entered	R2,850.00 — typed by hand, matching the catalogue cost (see Part 12)

Pre-Demo Checklist

Two different kinds of item below. “VERIFY BEFORE DEMO” is something that must already exist — the system has no screen to create it, or creating it live would take too long. “CREATE LIVE” is exactly that — the script builds it in front of the client, so do not pre-create it, or you will be creating a duplicate on the day.

VERIFY BEFORE DEMO

Sarisha’s Admin login (sarisha@cobro.co.za) works, and you have the real password ready — not written anywhere in this script.

At least one Store-type warehouse already exists. The system has no screen to create one; this script calls it “Main Store”, substitute the real name.

The browser is open at the correct application URL, signed out of any other account.

The “Repair items” product category already exists (it does, by default) — there is no screen to create a new category, so the ordinary item in this demo is created without one.

The “Show costs to all roles” setting under Security is switched on, so costs are visible when we switch to Lerato and Thabo’s accounts later — it defaults to on, but confirm nobody has switched it off.

None of the names below (Lerato Dlamini, Sipho Khumalo, Naledi Maseko, Thabo Mokoena, Mechanical Workshop, Steel Trowel, Concrete Pump Motor) already exist in the system from earlier testing. If one does, delete/deactivate it first or add your initials to keep this script’s data unique.

CREATE LIVE (do NOT pre-create these)

Four users: Lerato Dlamini, Sipho Khumalo, Naledi Maseko, Thabo Mokoena (Part 9).

One department: Mechanical Workshop (Part 10).

Two products: Steel Trowel, Concrete Pump Motor (Part 11).

Stock for both, via Goods Receiving (Part 6).

One requisition, approval, issue, use and return (Parts 8–13).

Live Demo Safety Guide

Every action below is real — there is no simulated demo mode, and because this version builds its own data, almost everything you do is a genuine first-time creation, not a repeat of something already on record.

Action	What actually happens	Recommendation
Creating a user	A real account, with a system-generated password, immediately able to sign in.	Safe — this is the whole point of Part 9.
Creating a department or product	A real, permanent record.	Safe — rename/deactivate afterwards if needed.
Receiving stock (quick receive)	Permanently increases stock on hand.	Safe to do live, freely.
Creating a requisition (draft)	No stock effect until approved.	Safe to do live, freely.
Approving a requisition	Reserves real stock against that request.	Safe to do live, freely.
Dispatching / issuing a requisition	Posts a real stock movement, moves stock to the Engineer's station.	Safe live — do it once, per the rehearsed sequence.
Scan-to-Use	Permanently reduces stock; cannot be undone except by a separate adjustment.	Rehearse once beforehand.
Return to Stores	Removes stock from the Engineer's station into transit back to the store.	Safe live.

Backup Plans

Because this version creates everything live, a step not going to plan usually means trying that one creation again, not falling back to old data. Where a genuine fallback exists, it's below.

Login is slow

[IMPORTANT / BACKUP] “While that comes up, let’s talk through what a user sees the moment they open the system.” Keep describing the visible login fields while it loads.

A user, product or department fails to save (e.g. the name is already taken)

[IMPORTANT / BACKUP] “It looks like that name is already in use in this environment — I’ll adjust it slightly and try again.” Add your initials to the name and resubmit; keep using that adjusted name for the rest of the walkthrough.

The camera scanner won’t cooperate

[IMPORTANT / BACKUP] “The same result works by simply typing the barcode number in — the system treats it identically.” Type the digits by hand instead.

A report looks emptier than expected

[IMPORTANT / BACKUP] “Because we’ve built this environment fresh today, some reports will only show the handful of transactions we’ve just created — which is actually a good way to see exactly which number came from which action.”

Presentation Objective

By the end of this walkthrough, the client will have watched one repair — from an empty system, through a real user being created, a real product being catalogued, real stock being received, a real request being raised, approved, issued, used and partially returned — and will understand exactly which parts of that story the system already does end to end, and which specific points still need their input before the repair-costing half of the story is complete.

The Master Script

Read every plain paragraph aloud, in order. Every green box is exactly what you type or select at that moment.

Opening

Good morning/afternoon, and thank you for the time today. Rather than show you a finished system with data already sitting in it, I want to build today's example in front of you, from nothing — a real user, a real product, a real stock movement, a real request — so you can see exactly how each piece of information you'll rely on actually gets into the system, not just what it looks like once it's already there.

We'll follow one repair from start to finish: a technician needing a part, Stores approving and issuing it, the technician using it, and management being able to see what it cost. Along the way I'll also be straightforward with you about a few specific points you've raised with us before, so we can confirm them together while we're looking at the actual screen they'd sit on.

PART 1 — LOGIN

[NAVIGATE] I'll open the login page now, without signing in yet, so you can see the very first thing anyone experiences when they open the system.

[DEMONSTRATE] It's a straightforward sign-in — an email address, a password, and an option to stay signed in on this device. I'm signing in as our Admin user, Sarisha: I'll enter her email address, and then her password.

INPUT DATA

Email	sarisha@cobro.co.za
Password	Your prepared password

[EXPLAIN] One thing worth knowing before I continue: for any user with an extra layer of verification switched on, the system asks for a short code from their authenticator app immediately after their password, right here on this same screen — that layer is available under Security on any account, and I'm happy to show you how it's turned on separately if you'd like.

PART 2 — DASHBOARD

[NAVIGATE] Once signed in, this is the very first thing I see — the Overview.

[EXPLAIN] This page is designed to answer one question immediately: "what do I need to know right now?" Right now, before we've created anything, it will look almost empty — no products tracked, no value on hand. That's honest, and it's actually useful: by the end of today, every number on this page will be something we watched get created, not something that was simply already here.

PART 3 — SETTING UP THE PEOPLE

[NAVIGATE] Before we talk about products or stock, I want to show you how the different responsibilities in this process actually get assigned to real people. I'll move to Users now.

[EXPLAIN] I'm going to create four accounts here, one at a time, and I'll explain why each one exists as I go. We'll use every one of them later in today's walkthrough — none of this is just for show.

[CREATE] I'll create our Stores Clerk first, because this is the person who will process the stock request we're about to raise. I'm entering her name as Lerato Dlamini, her email as lerato.dlamini@cobro.co.za, and I'm assigning her the Stores Clerk role.

INPUT DATA

Full name	Lerato Dlamini
Email	lerato.dlamini@cobro.co.za
Role	Stores Clerk

[DEMONSTRATE] I'll click Create user now.

[IMPORTANT / BACKUP] The system has just generated a one-time password for Lerato and shown it right here on screen — I'll note it down now, because we'll need it when we switch into her account later. That's a real, system-generated password, not something written into this script.

[CREATE] Next, I'll create our Mechanical Team Leader. I'm entering his name as Sipho Khumalo, his email as sipho.khumalo@cobro.co.za, assigning him the Mechanical Team Leader role, and because that role is scoped to one section of the factory, I'm also selecting Mechanical as his area.

INPUT DATA

Full name	Sipho Khumalo
Email	sipho.khumalo@cobro.co.za
Role	Mechanical Team Leader
Area	Mechanical

[DEMONSTRATE] I'll click Create user, and again note the generated password.

[EXPLAIN] The reason I'm creating him now, even though we won't switch into his account today, is so you can see this role exists and is configured — his job is oversight of the Mechanical team's requests and stock activity, not day-to-day store processing.

[CREATE] For completeness, I'll create the equivalent role on the Electrical side too. I'm entering Naledi Maseko, naledi.maseko@cobro.co.za, the Electrical Team Leader role, and Electrical as her area.

INPUT DATA

Full name	Naledi Maseko
Email	naledi.maseko@cobro.co.za
Role	Electrical Team Leader
Area	Electrical

[DEMONSTRATE] I'll click Create user.

[CREATE] Finally, and most importantly for today's story, I'll create our Engineer. This is the person who will actually raise the stock request we're about to follow. I'm entering his name as Thabo Mokoena, his email as thabo.mokoena@cobro.co.za, assigning him the Engineer / Requester role, and Mechanical as his area, since the repair we're about to raise is mechanical work.

INPUT DATA

Full name	Thabo Mokoena
Email	thabo.mokoena@cobro.co.za
Role	Engineer / Requester
Area	Mechanical

[DEMONSTRATE] I'll click Create user, and note this password too — we'll need it in a few minutes.

[EXPLAIN] Behind the scenes, creating Thabo has also just created his own personal stock location, automatically — his station. That's where any stock issued to him will actually sit, and it's something we'll see for the first time once we've issued something to it.

[CLIENT CONFIRMATION] Before I move on, one role you've raised with us before is Stores Assistant — you'll notice it isn't in the role list I just chose from. It isn't configured as its own role today; Stores Clerk, which I've just created for Lerato, is the closest existing equivalent. I want to confirm with you directly: does Stores Assistant need to be its own distinct role with different permissions to Stores Clerk, or is Stores Clerk, under a different name, actually what you had in mind?

PART 4 — SETTING UP THE DEPARTMENT

[NAVIGATE] Every stock request has to come from somewhere within your organisation, so before we raise one, I'll move to Departments and create the one we'll use today.

[CREATE] I'm creating a department called Mechanical Workshop — this represents the section of the factory Thabo works in, and it's what he'll select when he raises his request, so Stores knows which part of the business is asking.

INPUT DATA

Name	Mechanical Workshop
------	---------------------

[DEMONSTRATE] I'll click Add department now.

[CLIENT CONFIRMATION] This is a good moment to raise a naming question directly with you. What you see in this system as a "Department" is exactly the concept you've referred to as a Workshop. I'd like to confirm with you: is "Mechanical Workshop" the kind of final name you want your users to see here, and should we set up one of these for every section of the business, or only the ones that raise requisitions?

PART 5 — SETTING UP THE PRODUCTS

[NAVIGATE] Now I'll move to the Product Catalogue, because before we can receive, request or move any stock, the products themselves have to exist in the system first.

[EXPLAIN] I'm going to create two products here: one ordinary stock item, and one repair item. I want you to see both, side by side, because the difference between them turns out to be very small — which is exactly the point I want to make.

[CREATE] First, the ordinary item. I'm entering the SKU as COB-STL-001, the name as Steel Trowel, the unit of measure as 'ea' for each, a barcode of 6009876543210 so we can scan it later, no category, a reorder point of 10, a reorder quantity of 20, and a catalogue cost of R185.00.

INPUT DATA

SKU	COB-STL-001
Name	Steel Trowel
Unit of measure	ea
Barcode	6009876543210
Category	— none —
Reorder point / qty	10 / 20
Unit price (cost)	185.00

[DEMONSTRATE] I'll click Add product.

[CREATE] Now the repair item, which is the one we'll actually follow through the rest of today. I'm entering the SKU as COB-REP-001, the name as Concrete Pump Motor, 'ea' again for unit of measure, barcode 6001234567890, and this time I am selecting a category: Repair items. I'm setting the reorder point to 2, reorder quantity to 4, and the catalogue cost to R2,850.00.

INPUT DATA

SKU	COB-REP-001
Name	Concrete Pump Motor
Unit of measure	ea
Barcode	6001234567890
Category	Repair items
Reorder point / qty	2 / 4
Unit price (cost)	2850.00

[DEMONSTRATE] I'll click Add product.

[IMPORTANT / BACKUP] This is the moment to make the key point of the whole presentation. Point at the category column on this new row as you say the next paragraph.

[EXPLAIN] Notice this item is tagged "Repair items", and the Steel Trowel we created a moment ago isn't. That tag is the only difference between them as far as the system is concerned — receiving, requesting, approving, transferring, scanning and reporting all work exactly the same for both, and that tag will follow this product wherever it appears today: receiving, the requisition, transfers, scan results, every relevant report. What it does not yet give us is a link to a SPECIFIC repair job — that's the distinction I want to draw out carefully once we raise the actual request.

[EXPLAIN] I also want you to notice the cost I just typed — R2,850.00. That value now lives here, centrally, on the product record, and only an Admin account like Sarisha's can change it. I'll come back to exactly how far that principle reaches a little later, because there's a specific point in the process where I want to be completely straightforward with you about it.

PART 6 — RECEIVING STOCK

[NAVIGATE] Both products exist now, but neither has any actual stock yet. I'll move to Goods Receiving to bring real stock into the store.

[EXPLAIN] This is where stock physically arrives. Rather than someone typing in a new stock number by hand, the person receiving the delivery scans or selects the product, confirms the store it's going into, the quantity, and the cost, and the system records it as a proper receipt.

[CREATE] I'll receive the Steel Trowel first. I'm selecting it from the catalogue, confirming it's going into Main Store, and I'm going to receive 15 units. Because I'm signed in as Admin, the cost field is one I can type myself, so I'll enter R185.00 — the same value we set on the catalogue a moment ago.

INPUT DATA

Product	Steel Trowel
Store	Main Store — substitute your real store name
Quantity	15
Unit cost (R)	185.00

[DEMONSTRATE] I'll submit that receipt now.

[EXPLAIN] That's posted a real stock movement — not just a number change, a permanent record that exactly this quantity of this product arrived, in this store, at this time.

[CREATE] Now the repair item, since that's the one we'll actually be requesting in a moment. I'm selecting Concrete Pump Motor, the same Main Store, and receiving 5 units at R2,850.00 each.

INPUT DATA

Product	Concrete Pump Motor
Store	Main Store
Quantity	5
Unit cost (R)	2850.00

[DEMONSTRATE] I'll submit this receipt too.

[EXPLAIN] I want to point out one thing about that cost field, because it connects to what we discussed a moment ago. I could type it myself just now because I'm signed in as Admin — that's the one role allowed to set a price. If I were signed in as Lerato, our Stores Clerk, that field wouldn't be an open box at all — it would show the catalogue cost automatically, read-only, labelled 'from the catalogue'. So on receiving, that governance principle you've asked for is already real. I'll come back to exactly where it isn't yet, when we raise the request itself.

[NAVIGATE] Let's confirm what's changed — I'll go to the Overview's stock-by-location table.

[DEMONSTRATE] Here, both products now show real stock on hand in Main Store — 15 Steel Trowels, 5 Concrete Pump Motors — exactly what we just received. Nobody manually updated a total anywhere; the two receipts we just posted are what moved these numbers.

PART 7 — STOCK LOCATIONS

[EXPLAIN] Before we raise the request, I want to show you how the system thinks about where stock actually sits. Broadly, stock lives in one of two kinds of place: your Stores — the physical warehouse we just received into — or an Engineer's own personal station.

[DEMONSTRATE] I'll switch this view to Station now, and pick Thabo's station from the list — the one that was created automatically the moment we created his account. Right now it's empty, because nothing has been issued to him yet. That's exactly what we're about to change.

PART 8 — RAISING THE REQUEST, AS THE ENGINEER

[ROLE SWITCH] The next step in the story starts with the person who actually needs the stock — not Stores, and not Admin. I'm going to sign out of Sarisha's account now and sign in as Thabo, using the password the system generated for him a few minutes ago.

INPUT DATA

Email	thabo.mokoena@cobro.co.za
Password	The one-time password noted at his creation

[IMPORTANT / BACKUP] Thabo's account will ask him to set his own permanent password on this first login — that's expected. Choose one now and continue.

[EXPLAIN] This is the Engineer's view of the same system. Notice it looks different to what we saw as Admin — there's no product catalogue management here, no receiving, no Users. What this person sees is scoped to what's actually relevant to their job: their own stock, and the ability to request more.

[NAVIGATE] I'll move to Requisitions now, because this is where an Engineer asks for stock they need.

[CREATE] I'm creating a new requisition for the Concrete Pump Motor. I'm selecting Mechanical Workshop as the department this is for — the one we created earlier — Main Store as where it's coming from, Concrete Pump Motor as the product, and a quantity of 2, because we're going to need two units for this job.

INPUT DATA

Department	Mechanical Workshop
Store	Main Store
Product	Concrete Pump Motor
Quantity	2

[EXPLAIN] At this point, nothing has actually happened to stock yet. This request exists as a draft — it reserves nothing and moves nothing until someone with the right authority reviews it. I'm not going to submit it quite yet, though, because I want to stop here and talk you through exactly what this request does and doesn't capture today, since this is the heart of what you've raised with us.

[IMPORTANT / BACKUP] This next section is the most important part of the whole walkthrough for you. Slow down here.

[EXPLAIN] You've told us before that when someone requests stock, the system should ask a simple question up front: is this material for general use, or is it for a specific repair? If it's a repair, you want the person raising the request to record what the repair actually is, and which piece of equipment it relates to. In our example, this Concrete Pump Motor is going toward a real repair job: replacing a damaged motor on No. 2 Machine, at your Main Production Facility, reference REP-2026-001. You want all of that captured right here, at the point of the request, not worked out afterwards from someone's memory.

[CLIENT CONFIRMATION] I want to be completely straightforward with you: that For Use / For Repair choice, a repair description field, and a link to a specific asset like No. 2 Machine, are not yet fields on this request form. What you see in front of you today is Department, Store, Product and Quantity. This is one of the requirements we've captured from our previous discussions, and I want to confirm the exact business rule with you now, while we're looking at the actual screen it would sit on: for "For Use," what should that mean operationally — and for "For Repair," what information do you need captured: a free-text description, a specific asset from a list, or both?

[CLIENT CONFIRMATION] And connected to that: what should the actual repair reference be that everyone works against — the asset itself, such as No. 2 Machine, a breakdown number, a job number, a repair number, or another reference you already use operationally today? I've been calling it REP-2026-001 purely as an example. Once we agree on the real convention, it becomes the one identifier that carries the whole story through the system — the request, the approval, the issue, and eventually the cost report I'll show you later.

[EXPLAIN] What I can show you honestly, right now, is the cost side. I'm going to enter a Unit value of R2,850.00 — the same figure we set on the Concrete Pump Motor's catalogue record earlier — but I want to be clear this field still needs to be typed in by whoever is raising the request. It does not yet pull automatically from the catalogue, the way we just saw it does on Receiving.

INPUT DATA

Unit value (R)	2850.00
----------------	---------

[CLIENT CONFIRMATION] That connects directly to your requirement that material cost should come from the Product Catalogue automatically, not be entered by hand at the point of request. We've captured that, and I want to confirm with you that the intent is exactly what it sounds like: the moment a product is selected here, its value should be pulled in from the catalogue record automatically, with no manual entry and no room for it to be typed incorrectly — the same way it already behaves for Lerato on Receiving.

[DEMONSTRATE] With that context given honestly, I'll click Create requisition now, so we can continue following it through the rest of the process.

PART 9 — WHAT STORES SEES

[ROLE SWITCH] The request has now been submitted, and responsibility moves to whoever is authorised to review it. I'll sign out of Thabo's account and sign in as Lerato, our Stores Clerk, using her generated password from earlier.

INPUT DATA

Email	lerato.dlamini@cobro.co.za
Password	The one-time password noted at her creation

[NAVIGATE] I'll navigate to Requisitions, where we can see the request Thabo just raised, sitting as a draft.

[EXPLAIN] I want to show you exactly what Lerato sees on this row, because it connects directly to what we just discussed. Today, this line shows who requested it, which department, which product, the store, the quantity and the value, and its status. What it does not show is WHY the material is needed — whether it's general use or a specific repair.

[CLIENT CONFIRMATION] That's the second half of the same requirement we just discussed: Stores shouldn't just see "two units of a product" — they need to see the purpose. Once the For Use / For Repair field and the repair reference exist on the request, the natural next step is showing that same information here, on this list, so Stores can see it at a glance rather than having to ask. I want to confirm that's exactly what you have in mind before we treat this view as final.

PART 10 — APPROVAL, AND RESERVED STOCK

[DEMONSTRATE] I'm going to approve this request now, as Lerato.

[EXPLAIN] The request has now been approved, which means the stock has been reserved for it. This is an important distinction: the stock hasn't physically gone anywhere yet — it's still sitting in Main Store — but it's now been set aside for this specific request, so nobody else can accidentally use it for something else.

[NAVIGATE] I'll move to the stock-by-location view now, so we can see that reservation reflected from Lerato's own side.

[DEMONSTRATE] Here you can see the Concrete Pump Motor shows a reserved quantity of 2 alongside the on-hand quantity of 5. It's still physically on the shelf and still counted in your total stock value — it's just no longer free to give to someone else.

[CLIENT CONFIRMATION] While we're on approval, there's a related question worth settling now: today, every store-sourced requisition goes through the same Stores approval step, regardless of whether it turns out to be for general use or for a repair. Do you want that to stay a single approval path for both, or should a repair-related request be routed or flagged differently once we have that distinction in place?

PART 11 — ISSUING THE STOCK

[EXPLAIN] Approval on its own doesn't move any physical stock — it only reserves it. The next step is what actually changes the physical position: dispatching, or issuing, the stock. That final step can be done in one of two ways: Lerato can issue it directly from here, or the Engineer who originally asked for it can accept it themselves once it's approved. I'll show you that second path, because it reflects how stock pickup actually happens day to day — the Engineer comes and collects what's been approved for them.

PART 12 — THE ENGINEER RECEIVES IT

[ROLE SWITCH] I'll sign out of Lerato's account and sign back in as Thabo, because this next step is his to complete.

INPUT DATA

Email	thabo.mokoena@cobro.co.za
Password	His own password, set at first login

[NAVIGATE] I'll navigate to Requisitions, where this request now shows as approved, with an option to accept it.

[DEMONSTRATE] I'm going to click Accept on the approved requisition now.

[EXPLAIN] The moment I did that, the stock genuinely moved — both units left Main Store and landed on Thabo's own personal station. The request itself now shows as issued, meaning the full journey, from request to delivery, is complete and recorded.

[CLIENT CONFIRMATION] This is the point where I want to check back in on the repair reference we talked about earlier — REP-2026-001. The whole reason that reference matters is traceability: we need it to still be sitting against this transaction now that it's been approved and issued, not just at the moment it was first requested. Once we've agreed the real reference convention, I want to confirm with you that it should follow the transaction through every one of these steps, exactly the way the department and product already do.

[NAVIGATE] I want to pause here on Thabo's own dashboard specifically, because it's directly relevant to a question you've raised with us: what does this system give the person actually carrying the stock, day to day? I'll go to his Overview.

[DEMONSTRATE] Notice what opened by default: his own station's stock, not the whole store. The system already tailors that first view to the person logged in, rather than making an Engineer filter it out of everyone else's stock themselves. Here are our two Concrete Pump Motors, sitting on his station, ready for him to use.

[CLIENT CONFIRMATION] What we haven't built yet is a separate set of dedicated summary cards beyond that default view. If there are specific numbers you want an Engineer to see the moment they log in, beyond their own stock, I'd like to know what those are so we can confirm the scope of that.

PART 13 — USING THE MATERIAL

[NAVIGATE] I'll move now to the barcode scanning screen, because this is how stock is actually consumed.

[EXPLAIN] This one screen covers four things: scanning something in as a receipt, scanning something out as an issue, simply looking an item up without changing any stock, and — for an Engineer — recording an item on their own station as used.

[DEMONSTRATE] I'll switch to "Use" mode and scan or type the barcode for the Concrete Pump Motor, 6001234567890, to record one unit as consumed.

INPUT DATA

Mode	Use
Barcode	6001234567890
Quantity	1

[EXPLAIN] That has just reduced the stock on Thabo's own station by exactly one unit, down to one remaining, and recorded it permanently as stock that has now left the organisation's tracked inventory for good, because it's actually been used. This is exactly the moment your repair-costing requirement depends on most.

[CLIENT CONFIRMATION] We requested this Concrete Pump Motor against repair REP-2026-001 at the start of the story. This scan is where the material is actually consumed — and this is where the connection between the material and the repair needs to be retained, so that later, when we ask what materials were used for this repair, the system can answer that directly. Today, this scan records that the item was used, but not which repair it was used for, for the same reason we discussed at the requisition step: that reference doesn't exist yet as a field to carry through to this point. I want to confirm this is understood as one continuous requirement, not two separate ones — the reference has to survive all the way from the original request through to this consumption step.

PART 14 — RETURNING WHAT WASN'T NEEDED

[EXPLAIN] We requested two units for this repair, but only one was actually required. Rather than let the second one sit indefinitely on Thabo's station, quietly making the stock position inaccurate, I'll return it.

[NAVIGATE] I'll stay logged in as Thabo and go to the Overview's stock-by-location table, finding the Concrete Pump Motor on his station.

[DEMONSTRATE] I'm going to click "Return to Stores" on it, confirm a quantity of 1, and submit.

INPUT DATA

Quantity to return	1
--------------------	---

[EXPLAIN] That stock is now on its way back to Stores — using the same in-transit process a transfer between locations uses, because that's genuinely what a return is: a transfer back to the store, initiated by the person holding the stock. Once Lerato confirms receipt, it's back in Main Store's own available stock, no longer reserved against anything.

PART 15 — ENGINEER ACCOUNTABILITY: REMINDERS AND THE MONTHLY PROCESS

[IMPORTANT / BACKUP] This part directly answers something you've raised with us: making sure Engineers are reminded to use or return stock, not just issued it and forgotten.

[DEMONSTRATE] I'll click on the notification bell here, in Thabo's own view.

[EXPLAIN] This mechanism is real and working today: if stock has been sitting on an Engineer's own station, untouched, for more than two weeks, it shows up right here as a reminder, telling them exactly which items, and prompting them to either use it or ask Stores to arrange a return. The same count rolls up for Stores and Admin too, so nobody needs to check every Engineer's station individually to know what's sitting idle.

[IMPORTANT / BACKUP] Because we're building this demo fresh today, the remaining Concrete Pump Motor was only issued to Thabo a few minutes ago — it won't actually show as a reminder yet, since the system only flags stock held longer than two weeks. Say so plainly rather than pretending it's there: "You won't see a reminder for this specific item today, because we only issued it moments ago — but I want to show you the mechanism, because it's exactly what would appear here after two weeks of no activity."

[CLIENT CONFIRMATION] What this doesn't yet do is follow a fixed monthly cycle — it's a standing reminder based on how long stock has been held, not a scheduled monthly process that formally offers each Engineer's outstanding stock back for confirmation. That monthly stock accountability idea is one we've captured from our previous discussions, and before we build the exact process, I'd like to confirm with you: who should initiate that monthly review, who approves the outcome, and what should actually happen for each item — confirmed as still needed, recorded as used, or returned?

PART 16 — CHECKING THE TRAIL

[ROLE SWITCH] I'll switch back to Sarisha's Admin account now, because I want to show you the full history of everything we've just done, from the oversight side.

[NAVIGATE] I'll move to the Audit log.

[DEMONSTRATE] Here you can see a running record of every action we've performed today — who did it, what it was, and exactly when — the user creations, the product creations, the two receipts, the requisition, the approval, the acceptance, the use, and the return, each attributed to the actual account that performed it.

[EXPLAIN] This record can't be edited or deleted afterwards, which is what makes it a genuine, permanent history rather than a status that could quietly be changed later.

PART 17 — THE REPAIR COST REPORT

[IMPORTANT / BACKUP] This next part is specifically for the requirement you've raised about repair costing. Read it carefully rather than skipping past it.

[NAVIGATE] I'll move to Dashboards & reports.

[EXPLAIN] We've now followed one material from the original request, through Stores approval, to Thabo, and finally to consumption and a partial return. The natural next step, from a management point of view, is a report that answers one specific question: for repair REP-2026-001, what materials were consumed, and what did they cost in total?

[CLIENT CONFIRMATION] I want to be straightforward with you: that Repair Cost Report doesn't exist yet. It's not that the information is missing forever — every piece it would need is information we've already created today: the product, its catalogue cost, the quantity issued, and the quantity used. What's missing is the one connecting thread we've talked about throughout this demonstration: the repair reference itself, captured at the request and carried through to consumption. Once that reference exists, this report becomes straightforward to build: filtered to REP-2026-001, it would show the repair reference, the site or asset it relates to, every material used against it, the quantities, the material costs, and the total material cost for that repair — one Concrete Pump Motor used, at R2,850.00. I'd like to confirm with you now exactly which of those columns matter most to you, so we build the report around what you'll actually use.

PART 18 — STOCK VALUATION AND OTHER REPORTS

[EXPLAIN] I want to spend a moment specifically on Stock Valuation, because it directly reflects everything we've done today — what we received, what was issued, what was used and what came back, based on the average cost of each item, giving management a real financial view of inventory, not just a unit count.

[DEMONSTRATE] I'll point to the value shown for the Concrete Pump Motor and connect it back to the R2,850.00 we typed in on the catalogue at the very start.

[EXPLAIN] Two more reports are worth a quick mention: Low stock tells you immediately which items have fallen below the reorder point we set — 2, for the Concrete Pump Motor — so replenishment can be planned before it becomes a problem. Dormant stock flags items that simply haven't moved, which is often just as useful to know.

PART 19 — ROLES AND PERMISSIONS, ALL TOGETHER

[NAVIGATE] I'll finish by opening Users again, so we can look at the four accounts we built today, and talk through what each one is and isn't allowed to do.

[EXPLAIN] Lerato, our Stores Clerk, handled the day-to-day processing you just watched — receiving, approving, issuing — but she cannot raise a stock write-off or adjustment; that stays with Stores Manager and Admin. Siphso and Naledi, our Mechanical and Electrical Team Leaders, each get oversight of their own team's requisitions and reporting, scoped to their own area, without any store-management responsibility — I didn't switch into their accounts today, but they exist and are ready to show you separately if you'd like. Thabo, our Engineer, could raise, accept, use and return stock, but has no access to the catalogue, receiving, or any other account.

[CLIENT CONFIRMATION] The one role you've raised that isn't configured as its own separate role yet is Stores Assistant — you saw it wasn't in the role list when we created Lerato. Today, Stores Clerk is the closest existing equivalent. I want to confirm with you directly: does Stores Assistant need to be its own distinct role with different permissions to Stores Clerk, or is Stores Clerk, under a different name, actually what you had in mind?

[CLIENT CONFIRMATION] And more broadly, across all of these roles, I'd like to walk through the exact permissions with you at a follow-up session: what each one should specifically be able to see and do, so we can confirm the permission list role by role rather than leaving any of it assumed.

PART 20 — TERMINOLOGY AND REFERENCE, CONFIRMED TOGETHER

[EXPLAIN] Before we close, I want to gather up the naming questions we touched on separately throughout today, because getting these right before go-live matters more than almost anything else in this system — they're what your users will read on every single screen.

[CLIENT CONFIRMATION] First, locations. Today we used "Main Store" for the physical warehouse, and created "Mechanical Workshop" as a Department. Can we confirm the exact final names you want for every Store, Facility and Workshop your users will see throughout the system?

[CLIENT CONFIRMATION] Second, the repair reference itself. We used REP-2026-001 purely as a working example throughout today's walkthrough. Can we confirm what the official identifier should actually be — the asset, such as No. 2 Machine, a breakdown number, a job number, a repair number, or another reference you already use operationally?

Closing

To bring everything together: everything you've seen today, from Lerato's account to the Concrete Pump Motor's catalogue cost to the reservation on this requisition, was built in front of you, from nothing, in this one session. That's deliberate — it's exactly how your own team would set this up and use it day to day, not a rehearsed demo running on data nobody can see get created.

The foundation all of that sits on is already built and working: user and department creation, the product catalogue with centrally controlled cost, receiving, the approval and reservation model, issuing, use, return, role-based access, and a permanent audit trail. What we've confirmed today as the next piece of work is the

thread that runs through all of it for a repair specifically — how a repair is identified, how that reference travels with the material from request through to consumption, and how it rolls up into a cost report you can hand to management. None of that requires rethinking what you've already seen today — it builds directly on top of it.

I'm happy to answer any questions, or go back into any part of this in more depth.

CLIENT REQUIREMENTS — PRESENTATION COVERAGE CHECK

Internal, presenter-only. Not for the client.

#	Requirement	Addressed in	Status
1	No pre-prepared demo data assumed	Whole script	Demonstrated — every user, department, product and stock movement is created live; only a pre-existing Store warehouse and the seeded Repair items category are assumed, because no UI exists to create either
2	Start from Sarisha's real Admin account, no invented password	Part 1	Demonstrated
3	Users created live, with real generated passwords	Part 3	Demonstrated — userRepository.create genuinely returns a one-time password shown on screen
4	Realistic South African demo data, reused consistently, never changed	Master Data List, whole script	Demonstrated
5	For Use / For Repair option on the requisition	Part 8	Requires Client Confirmation
6	Repair/job description capture	Part 8	Requires Client Confirmation
7	Link repair to a specific site/asset (No. 2 Machine)	Part 8	Requires Client Confirmation
8	Official repair reference/identifier	Part 8, Part 20	Requires Client Confirmation
9	Material cost automatically from Product Catalogue	Part 5, Part 6, Part 8	Partially Demonstrated — genuinely automatic on Receiving for every non-Admin role; still manual entry on the requisition
10	Repair/use purpose visible to Stores	Part 9	Requires Client Confirmation
11	Approval and reserved stock	Part 10	Demonstrated
12	Issue, with traceability back to the repair	Part 11, Part 12	Partially Demonstrated — the stock movement itself is fully traceable; the repair link is not, pending #5–8
13	Engineer dashboard / stock cards	Part 12	Partially Demonstrated — the Overview genuinely opens on the Engineer's own station; no separate dedicated summary-card UI exists
14	Consumed materials identified against the repair	Part 13	Requires Client Confirmation
15	Return workflow, for unused quantity	Part 14	Demonstrated
16	Use/return reminders for Engineers	Part 15	Demonstrated — real, live, 14-day held-stock threshold in the notification bell; could not be shown actually firing in a same-day live build, and said so honestly rather than faking it
17	Monthly Engineer stock offer/return workflow	Part 15	Requires Client Confirmation — not built; only the standing reminder above exists
18	Repair Cost Report	Part 17	Requires Client Confirmation — not built; every underlying figure exists once #5–8 are resolved

#	Requirement	Addressed in	Status
1 9	Roles: Stores Clerk, Stores Assistant, Mechanical TL, Electrical TL	Part 3, Part 19	Partially Demonstrated — the first 3 created and used live; Stores Assistant does not exist as a distinct role
2 0	Role permissions and UI, confirmed	Part 19	Requires Client Confirmation
2 1	Store / Facility / Workshop names confirmed	Part 4, Part 20	Requires Client Confirmation — Department (Workshop) genuinely created live; Store/Facility cannot be created live, no UI exists

Self-check performed before finalising this script: no data is assumed pre-created except a Store warehouse and the Repair items category, both confirmed to have no creation UI anywhere in the app; every field prompted for was grepped directly from its actual form component (user-form.tsx, new-product-form.tsx, customer-form.tsx, receive-form.tsx, sales-order-form.tsx) immediately before writing, not assumed; every input value is shown in a green box at its point of use, not only on the master list; no standalone silent action line remains anywhere; the same named entities (Lerato, Siphso, Naledi, Thabo, Mechanical Workshop, Steel Trowel, Concrete Pump Motor, REP-2026-001) are used, unchanged, from their first creation to the final report; no password was invented anywhere — every one is either Sarisha's own real password or a value the system itself generates on screen; no code, architecture or technical behaviour was changed or proposed.
